RESEARCH PROJECTS

- Building adversarially robust neural network using entropy regularization.
 - Devised a new algorithm for training neural networks robust to adversarial perturbation, with better generalization properties, using entropy and stochastic gradient langevin dynamics.
- Provable inverse imaging using deep generative priors.
 - Introduced a new provably convergent algorithm for solving inverse problems such as compressed sensing with pre-trained generative priors using stochastic gradient langevin dynamics.

- Inverse imaging using deep untrained neural network priors. [\[code\]](#)
 - Used deep untrained CNNs as priors for inverse imaging problems such as compressed sensing, phase retrieval and HDR imaging, showed superior empirical performance. Provided theoretical guarantees for convergence of gradient descent based solution.
- Inverse imaging from magnitude-only measurements using structured sparsity priors. [\[code\]](#)
 - Phase retrieval using structured sparsity: used underlying structure (such as block and tree sparsities) in images to develop fast and memory efficient algorithms to reconstruct images from absolute-valued measurements with theoretical guarantees.
- Image and video super-resolution via ptychography. [\[code\]](#)
 - Developed algorithms for super-resolution of multiplexed microscopic images by using sparsity and low rank priors.
